

Requirement Statement :

Provided, n is a multiple of 2. Ratio of smart students to non-smart students is 1:1 for the whole class. The objective is to achieve a seating arrangement such that all the below are considered :

1. Every row has the same ratio of smart students to non-smart students
2. Every column has different ratios of smart to non-smart students
3. The ratio of smart to non smart students is as different as possible in every diagonal.

Estimation :

Task	Time Estimated (in hour-per-person)	Time Taken (in hour-per-person)
Analysis and Requirement Clarification	1	0.5
Technical Design	2	1.5
Implementation	2	2
Testing and Bugfixes	2	2.5
Total	7	6.5

Solution Architecture :

Language used for Implementation : Java

Let Smart student be represented as S. Non-smart student be represented as N. User input 'n' is the dimension of the matrix (number of row or column)

Since $N:S = 1:1$, and n is fixed for all rows (square matrix), hence, for each row, $N:S$ must be 1:1. Also, if all columns have different ratios, each column will have a different number of N or S. For all ratios to be different, hence, the columns will have N or S ranging from 0 to $n/2-1$ and $n/2+1$ to n [if any column have N or S as $n/2$, it violates either the row ratio or the column ratio property].

Approach taken :

1. Fill the matrix till $n/2+1$ rows with $n/2$ 'N' from the left and then remaining $n/2$ 'S'
2. For the rest of the matrix :
 - i. From the left, fill lower/left triangular matrix with 'N' till column $n/2-1$

ie -

```

| \
| \
| \
| \

```

- ii. Fill upper left triangular matrix with 'N' from column $n/2$ to $n-1$

ie -

```

|---/
| /
| /

```

- iii. Fill the rest by 'S'

3. Swap column 1 and column n in the resultant matrix.

4. Swap row 1 and $n/2+1$ in the resultant matrix.

Testing Code :

- The program checks if 'n' is a multiple of 2. If not, the program terminates and a re-run is required.
- A function 'validate' is implemented additionally to check if for any value of 'n', any of the two mentioned properties (property 1 and property 2) is violated according to the implementation. The program exits in that case without printing the seating arrangement.
- The program also prints :
 - i. The ratio N:S for the rows.
 - ii. All the distinct ratios of the diagonals and the count of diagonal per ratio.
 - iii. The count of distinct diagonals.

Running Instructions :

To run the program,

Go to folder containing the jar file.

Type : **java -jar findSeatingPlan.jar <dimension>**

Sample Output :

```
sroy@sroy: ~
sroy@sroy:~$ java -jar findSeatingPlan.jar 10
ratio : 0.0      has diagonals : 3
ratio : 0.5      has diagonals : 2
ratio : 1.0      has diagonals : 6
ratio : 1.5      has diagonals : 2
ratio : 5.0      has diagonals : 1
ratio : 2.5      has diagonals : 1
ratio : 1.6666666 has diagonals : 1
ratio : 1.25     has diagonals : 2
ratio : 0.6666667 has diagonals : 2
ratio : 0.8      has diagonals : 2
ratio : 0.3333334 has diagonals : 2
ratio : 0.75     has diagonals : 1
ratio : 4.0      has diagonals : 1
ratio : Infinity has diagonals : 3
ratio : 2.0      has diagonals : 2
ratio : 0.2      has diagonals : 1
ratio : 0.4      has diagonals : 1
ratio : 0.6      has diagonals : 1
ratio : 3.0      has diagonals : 2
ratio : 1.3333334 has diagonals : 1
ratio : 0.25     has diagonals : 1
All rows have N:S ratio as : 1.0
All columns have different N:S ratio.
Count of distinct diagonal ratios : 21
Please see the seating arrangement below :
